LEAKAGE TEST

Before returning the unit to the user, perform the following safety checks:

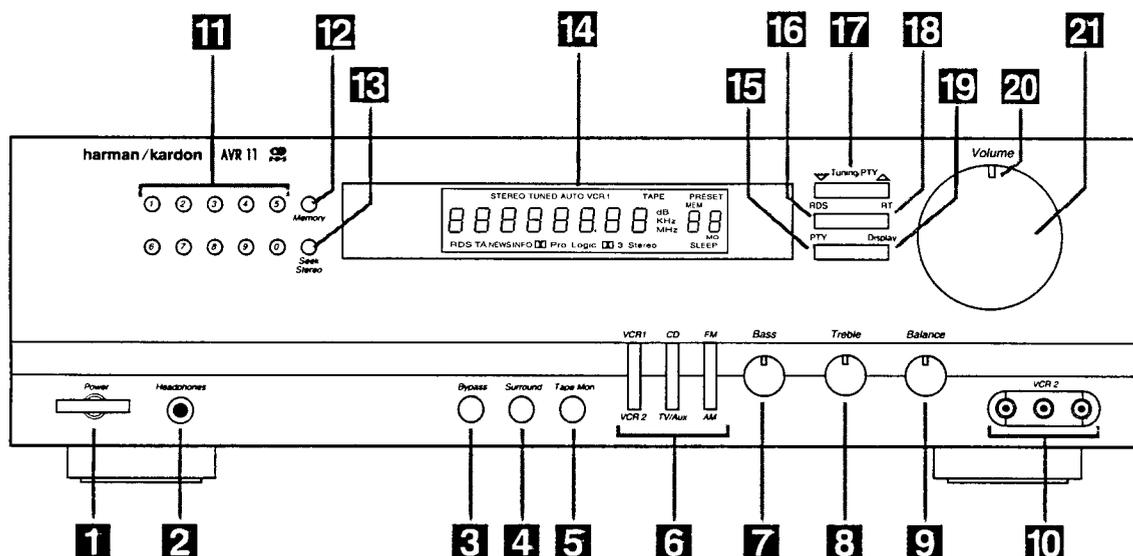

1. Inspect all lead dress to make certain that leads are not pinched or that hardware is not lodged between the chassis and other metallic parts in the unit.
2. Be sure that any protective devices such as nonmetallic control knobs, insulating fishpapers, cabinet backs, adjustment and compartment covers or shields, isolation resistor-capacity networks, mechanical insulators, etc., which were removed for servicing are properly reinstalled.
3. Be sure that no shock hazard exists; check for leakage current using Simpson Model 229 Leakage Tester, standard equipment item No. 21641, RCA Model WT540A or use alternate method as follows: Plug the power cord directly into a 230-volt AC receptacle (do not use an Isolation Transformer for this test).

Using two clip leads, connect a 1500 Ohm, 10-watt resistor paralleled by a $0.15\mu\text{F}$ capacitor, in series with all exposed metal cabinet parts and a known earth ground, such as a water pipe or conduit. Use a VTVM or VOM with 1000 Ohms per volt, or higher sensitivity to measure the AC voltage drop across the resistor. (See Diagram.) Move the resistor connection to each exposed metal part having a return path to the chassis (antenna, metal cabinet, screw heads, knobs and control shafts, escutcheon, etc.) and measure the AC voltage drop across the resistor. (This test should be performed with the power switch in both the On and Off positions.)

A reading of 0.35 volt RMS or more is excessive and indicates a potential shock hazard which must be corrected before returning the unit to the owner.

CONTROLS AND FUNCTIONS

1 POWER Button: Press this button to turn the power on. Press again to turn the power off. If you connect other components to the switched outlet, it can also be used as a system power button.

2 HEADPHONE Jack: Stereo headphones may be plugged into this jack for private listening. Headphone impedance should be between 8 and 2K ohms. Best results are between 200 and 400 ohms.

3 BYPASS Selector: Defeats all surround modes.

4 SURROUND MODE Selector: Press this button to select the desired surround mode. The mode is changed between normal DOLBY Pro-Logic and DOLBY 3-STEREO.

5 TAPE MONITOR Button: Press this button to select input from a tape deck or to monitor a recording in progress.

6 INPUT Selector Buttons: Press these buttons to select the desired input source.

7 BASS Control: Modifies the low-frequency sound of the left and right channels as much as ± 10 dB. Set this control at a suitable position for your taste and room acoustics.

8 TREBLE Control: Modifies the high-frequency sound of the left and right channels as much as ± 10 dB. Set this control at a suitable position for your taste and room acoustics.

9 BALANCE Control: This control is used for balancing the relative sound volume of the left and right channel speakers. Clockwise rotation reduces the volume from the left speaker, counterclockwise rotation reduces the volume from the right speaker.

10 VCR2 A/V INPUT Jacks: Connect these jacks to the corresponding output jacks of a VCR.

11 STATION PRESET Buttons: These buttons are used to recall or store preset stations. Pressing the buttons will automatically choose the tuner as an input and switch to the selected station. Pressing the buttons after pushing **MEMORY 12** will store a station's frequency to the desired location.

NOTE: To select or enter a preset location between 10 and 29 you must select the second digit within 2 seconds of the first. To select preset location 30, simply press **0**.

12 MEMORY Button: Press these buttons to store an AM or FM frequency in the unit's memory. The **MEMORY** indicator will blink in the display to remind you to choose a location using the **STATION PRESET 11** buttons. Press the button a second time to complete the memorization process. Storing a station in a memory location that has already been used will overwrite the existing data.

NOTE: The preset memories are protected from power loss for two weeks. If the unit is unplugged for more two weeks, all stored frequencies will be erased.

18 SEEK / STEREO Button: Press this button, **AUTO** will illuminate in the display. Then press the Tune/Preset button. The tuner will automatically seek out stations in your area that have enough signal strength to be listenable. The tuner continues to seek additional stations until the **SEEK/STEREO** button is pressed again.

14 DISPLAY WINDOW: The indicators in this display provide information about the input source, tuner/RDS operation and surround options. The IR remote sensor is also behind this window.

NOTE: For optimal operation of the remote control be certain that the window is not blocked by cabinet doors or other obstructions.

15 PTY (Program Type Search): When the RDS system is engaged by pressing **RDS SELECTOR 16**, this button is used to initiate a search for stations with a specific Programme Type (PTY). Press this button and note that **PTY SEL** appears in the display window. Use the **TUNE/PTY** button to scroll through the list of available PTY types and press this button again to scan for your selection. The display will indicate the preset number for all stations with the correct PTY and tune to the strongest.

16 RDS SELECTOR: Press this button to activate the RDS system. Note that **RDS** will appear in the display window. Pressing the **TUNING/PTY 17** button will advance the tuner to each available station that is transmitting RDS data. Press the button again to resume tuning of all stations.

17 TUNING/PTY ▲ ▼: When the tuner is selected, pressing ▼ tunes to stations with lower frequency, pressing ▲ tunes to higher frequencies. This button is also used to scroll up or down through the list of PTY choices when the RDS system is in use.

18 RT Selector: When the RDS system is engaged by pressing **RDS 16** selector, pressing this button will display a rolling text message with additional data about the station or programme being transmitted. If there is no RT message the display will indicate **NO RT**.

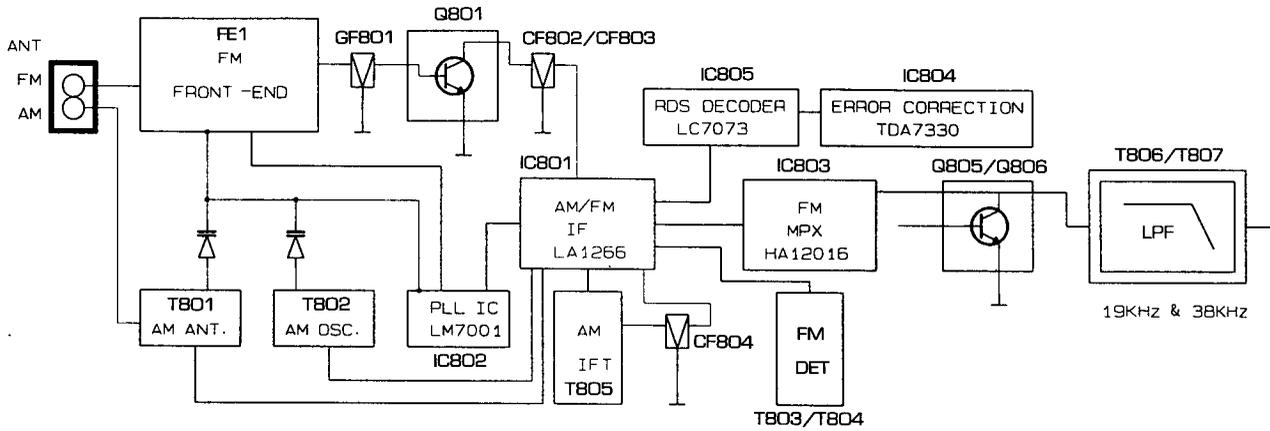

19 RDS DISPLAY Button: Pressing this button when the RDS system is engaged will change messages in the display window. The normal display is the Station Name. Press the button once to display the Programme Type (PTY) and again show the correct clock time (CT). Press again to return to the Station Name. If no data is available for the station being tuned, a message to that effect will appear in the display.

20 POWER/MUTE: This indicator will glow in a green color whenever the unit is turned on and its position gives you a relative indication of the volume level. When the volume is muted by pressing the **MUTE 17** button on the remote, the indicator will flash as a reminder that the unit is on, but the speaker output has been temporarily silenced.

21 VOLUME Control: Turn the knob clockwise to increase the volume and counterclockwise to decrease it. The volume of the front, center and rear channels is changed at the same time. Note that the volume control is motorized, and will rotate automatically when the volume is changed with the remote control.

3. PROTECTION CIRCUITS

1) SPEAKER PROTECTION CIRCUIT

The CPU protects both this unit and the speakers when an abnormally high current flows in Q215 L/R and Q216 L/R due to excessive input drive, too low of a load impedance, or short of the speaker terminals. If current increase is excessive the voltage across R226 L/R or R227 L/R turns on Q217 L/R, then Q218 turns on Q220.

It makes the protection port of the CPU to low state.

Then the power is turned off.

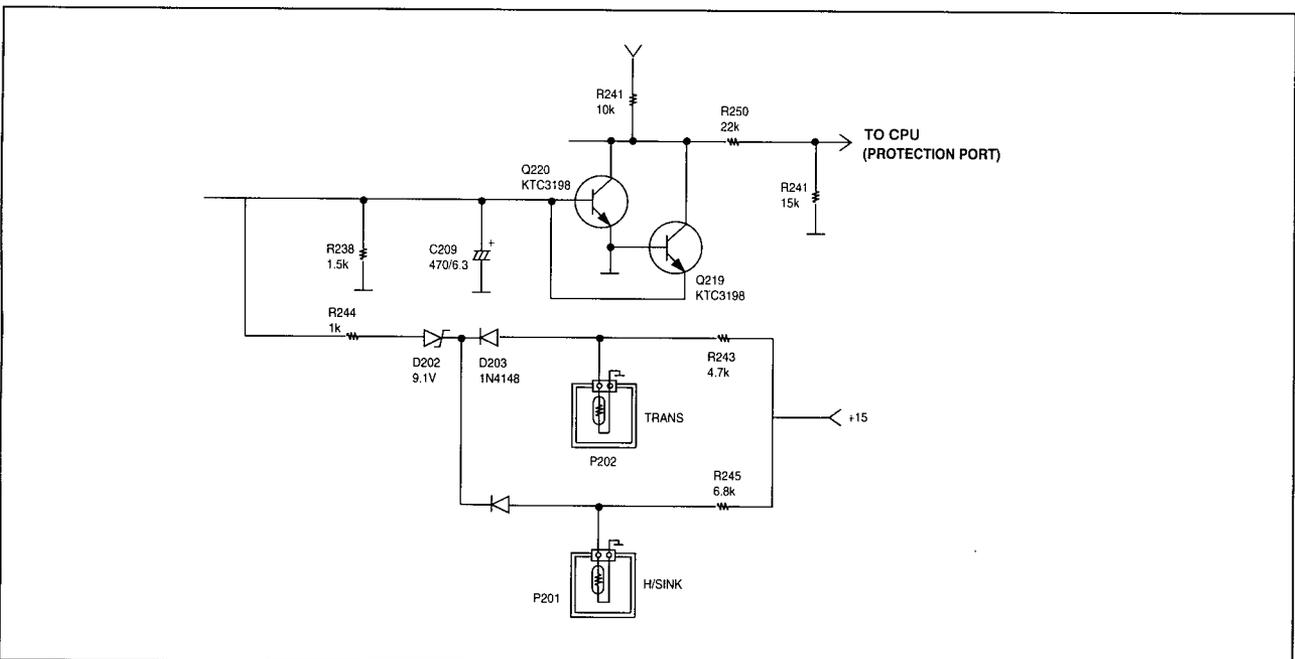

2) THERMAL PROTECTION CIRCUIT

This receiver has an overload thermal protection circuit to guard against abnormal operation.

When the temperature of TRANS POSISTOR installed with the main transformer or H/SINK POSISTOR rises abnormally, the resistance of the posistor becomes high and Q220 is turned on.

It makes the protection port of the CPU to a low state. Then the power is turned off.

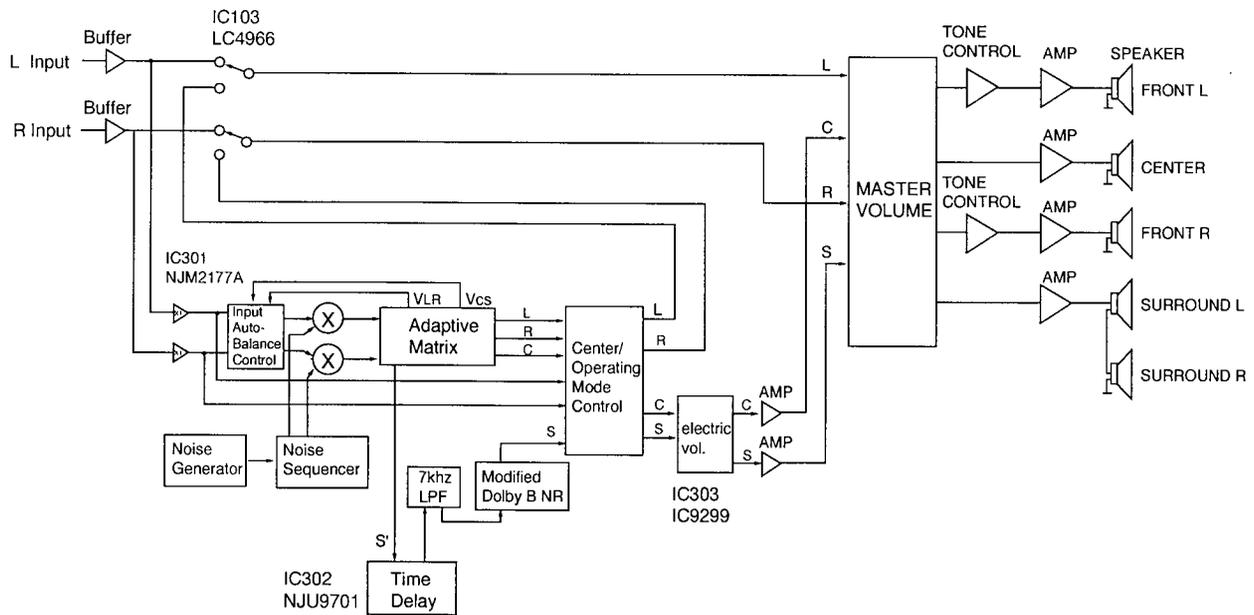

4. SURROUND CIRCUITS

This model incorporates a surround processor circuit.

Fig. 1 is a block diagram of the surround processor circuit.

The microprocessor transfers the data to the Dolby Pro – Logic decoder and Time Delay Device to operate the circuits in each mode.

<Block diagram of the surround processor circuit>

Fig. 1

1) OFF

Set to this mode to listen to ordinary stereo sound.

The rear L/R and center outputs will be muted.

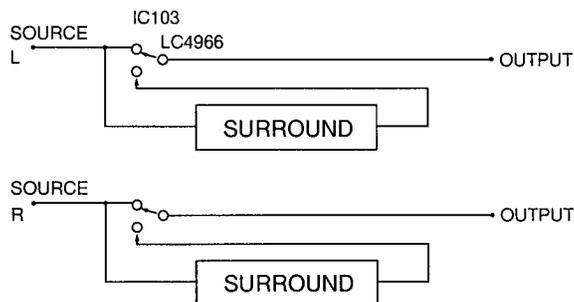

Fig. 2

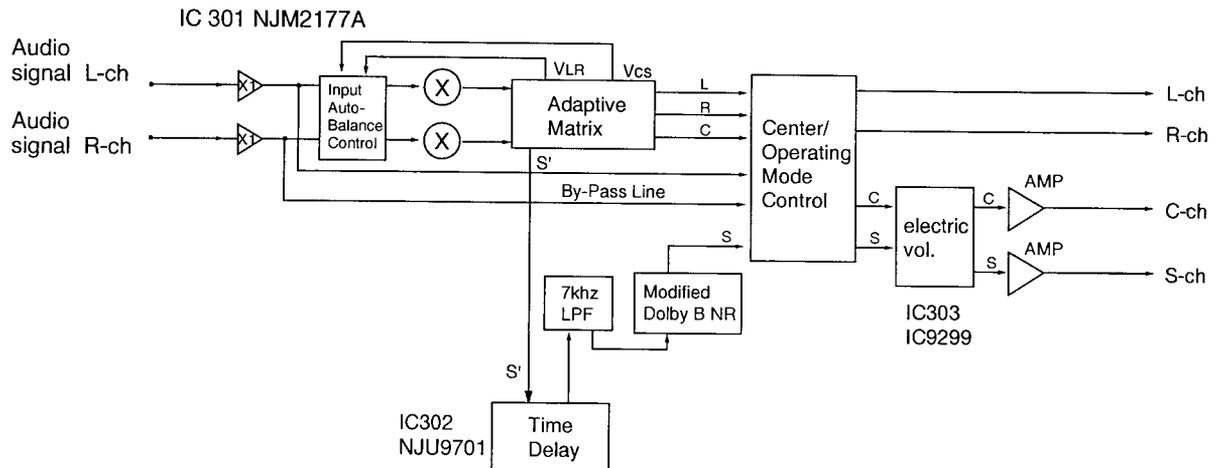

2) DOLBY PRO – LOGIC CIRCUIT

Dolby Pro – Logic is a sound effect system for movies developed by the Dolby Laboratories Licensing Corp. IC301 (NJM2177A) is a Dolby Pro – Logic decoder IC.

When an audio signal recorded using the Dolby Pro – Logic system is sent to this IC, the left, right, center and surround components are separated.

The surround signal component is delayed by the delay IC302 (NJU9701).

Fig. 3 Shows the configuration of the dolby decoder.

<Flow of signals within the system in the Dolby Pro – Logic mode>

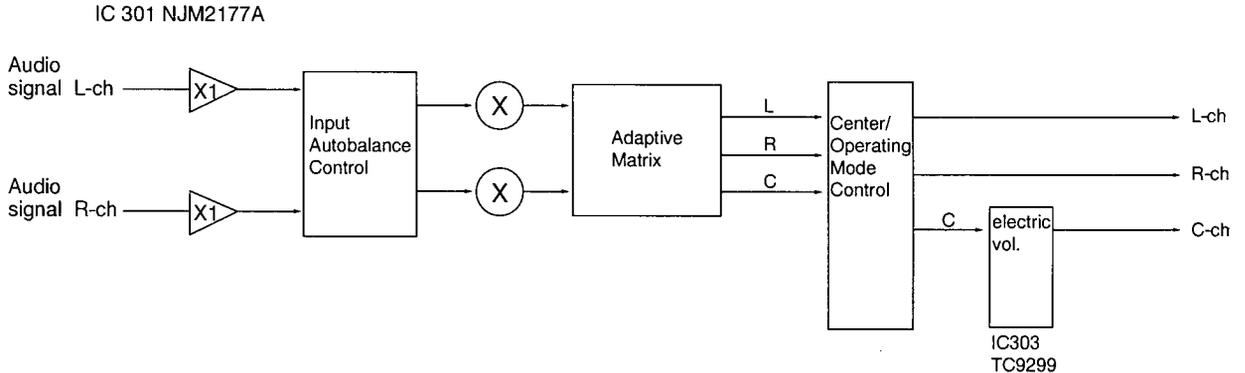

Fig. 3

With Dolby pro logic, three center modes depend on the use of a center speaker as follows.

NORMAL	: Bass frequencies are sent only to the Left and Right Front channels. Select this mode when the Center Speaker is smaller than the Left and Right speakers.
WIDE	: Bass frequencies are sent to the Left, Center and Right speakers. Select this mode when the Center speaker is approximately the same size as the Left and Right speakers.
PHANTOM	: Center channel information is sent to the Left and Right speakers. Select this mode when you do not have a center channel speaker.

3) STEREO CIRCUIT

In 3 – stereo mode, surround sound is sent to front Left channel and front Right channel and no surround sound is sent to surround channel.

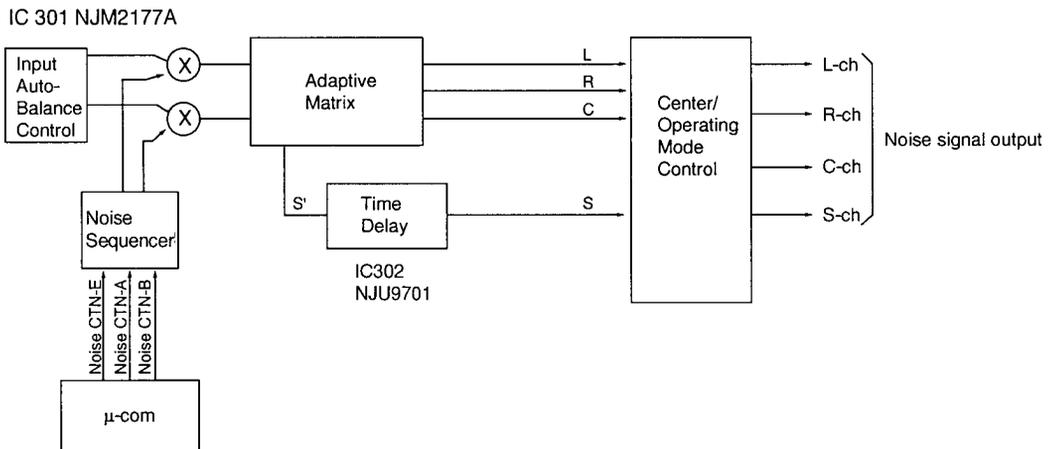

<Flow of signal within the system in the 3 – stereo mode>
Fig. 4

4) TEST TONE GENERATOR

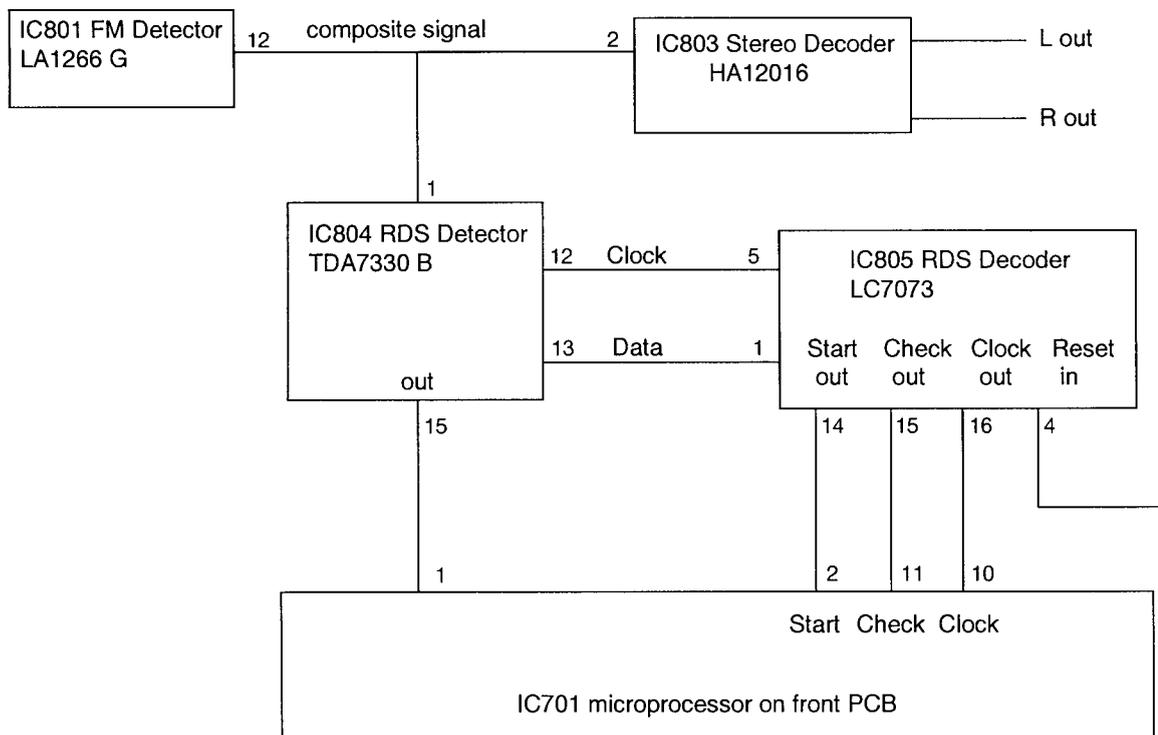

The test tone generator generates a test tone (noise) to check the balance of sound output from each speaker in the Dolby pro logic mode. (This circuit is produced under license of the Dolby Laboratories Licensing Corp.) The noise generator signals shown the table below applies to the Noise – CNT – A/B/E pins of IC 301. The test tone is sent to the loud – speakers at 2 second intervals in the following sequence : Left, Center, Right, Rear (both rear channels).

Fig. 6

IC701 Pin and function descriptions for RDS

Pin 1 RI ⇒ Output for RDS indication

Pin 2 Start ⇒ Serial data start output

Pin 11 Check ⇒ Serial data output check

Pin 10 Clock ⇒ Serial data output clock

RDS information in the composite signal is fed to pin 1 of RDS Detector (IC804).

IC804 performs the following functions;

– Remove Low frequency audio information and pass the 57 kHz subcarrier.

– Lock onto the 57 kHz subcarrier, recover the clock signal and get the demodulation of original RDS data.

The Low level signal from pin 15 of IC804 is fed to pin 1 of the microprocessor (IC701).

The recovered clock signal from pin 12 of IC804 is fed to pin 5 of the RDS decoder (IC805).

The decoded Low signal from pin 14 of IC804 is fed to pin 6 of IC805.

The RDS Detector (IC805) performs the following functions;

Logic reset (During power on, pin 4 is momentarily connected to ground for chip reset.)

Convert serial data from pin 6 (Data in) and pin 5 (Clock) into parallel data.

Error detection and correction.

It provides group synchronization.

The Low level momentary signal from pin 14 of IC805, is fed to pin 2 of the microprocessor (IC701), and lets you know the start point of one block of RDS data.

The data signal from pin 15 of IC805, is fed to pin 9 of the microprocessor (IC701), and lets you know the content of RDS data.

The clock signal from pin 16 of IC805, is fed to pin 10 of the microprocessor (IC701), and lets you know the frequency clock of RDS data.

PRODUCT SAFETY NOTICE

Each precaution in this manual should be followed during servicing. Components identified with the IEC symbol △ in the parts list are of special significance to safety. When replacing a component identified with △, use only the replacement parts designated, or parts with the same ratings of resistance, wattage or voltage that are designated in the parts list in this manual. Leakage-current or resistance measurements must be made to determine that exposed parts are acceptably insulated from the supply circuit before returning the product to the customer.
