

# NEC

MODEL CT-2062S

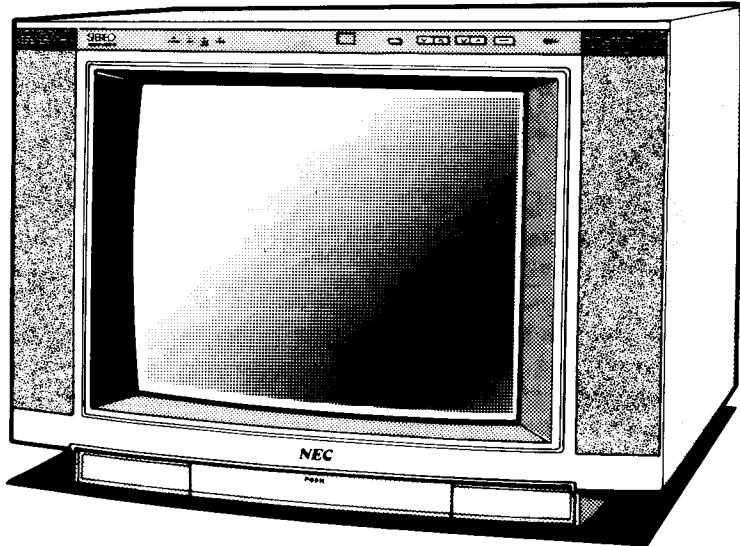

COLOR TELEVISION MONITOR

## SERVICE MANUAL

PART NO. 399910630

**Better Service  
Better Reputation  
Better Profit**

**SAFETY CAUTION:**

Before servicing this chassis, it is important that the service technician read and follow the "Safety Precautions" and "Product Safety Notice" in this Service Manual.

\* For continued X-radiation protection, replace picture tube with original type or NEC approved equivalent type.

**WARNING:**

SHOCK HAZARD — Use an isolation transformer when servicing.

**NEC Corporation**

TOKYO, JAPAN

# SERVICE ADJUSTMENTS

## 1. +B2 VOLTAGE

- (1) Confirm that AC voltage is 120Vrms, 60Hz.
- (2) Connect a DC voltmeter between pin 1 (ground) and pin 4 of IC601, then check that +B2 voltage is within 130V  $\pm$  1VDC.

## 2. VIF ADJUSTMENT

### 2-1. PIF Adjustment (T201)

- (1) Feed in a non-modulated 45.75 MHz/15mVrms signal to the IF IN terminal of the tuner.
- (2) Connect the AGC VR to pin 22 of IC201 as shown in Fig. 1.

IF IN terminal is on the solder side of the tuner

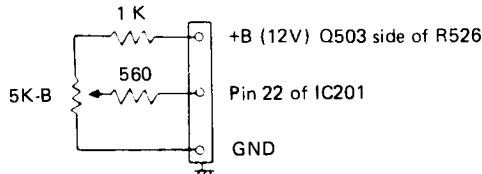

Fig. 1 AGC VR

- (3) Connect a digital voltmeter to pin 47 of IC201 and adjust the AGC VR so that the voltage at pin 47 of IC201 is approx. 4.5V.
- (4) Adjust T201 to maximize the voltage at pin 47.
- (5) If the voltage at pin 47 exceeds 5V, repeat steps (3) and (4).

### 2-2. AFT Adjustment (T202)

Note: This adjustment must be done only after T201 adjustment is completed.

- (1) Repeat "PIF adjustment" steps (1) through (3).
- (2) Connect a digital voltmeter to pin 22 of IC101 (IC101 side of R151).
- (3) Adjust T202 so as to obtain 2.7  $\pm$  0.1VDC at pin 22 of IC101.

### 2-3. QUASI SIF Adjustment (T203)

- (1) Feed an AM modulated test signal (carrier frequency 45.75MHz, and modulated at 30% by a 15.75kHz, 15mVrms) into the IF terminal of the tuner.
- (2) Connect an oscilloscope to pin 41 of IC201.
- (3) Adjust T203 so as to minimize the signal on the oscilloscope.
- (4) Next, feed in a standard color bar signal and non-modulated sound signal.
- (5) Connect an oscilloscope to pin 34 of IC201.
- (6) Adjust T203 so as to minimize the signal on the oscilloscope.

## 3. RF AGC ADJUSTMENT

- (1) Feed in a standard color bar signal (60dB $\mu$  at 75 $\Omega$  terminated).
- (2) Connect a DC voltmeter (or a digital voltmeter) to the AGC terminal of TUNER (TP103).

- (3) Adjust the RF AGC VR (VR201) so that the voltage on the voltmeter stops just before it reaches maximum reading (approx. 7V).
- (4) Increase the input signal level by 3dB $\mu$  (to 63dB $\mu$ ) and check that the reading on the voltmeter decreases by more than 1.5 VDC. If necessary, repeat steps (3) and (4).

#### 4. SIF ADJUSTMENT (T301)

- (1) Into pin 36 of IC201, feed an FM modulated signal (Carrier frequency 4.5MHz, modulating signal 1kHz, 7.5kHz frequency deviation, 100mVrms) through a 0.1 $\mu$ F capacitor.
- (2) Connect an oscilloscope to pin 34 of IC201 (IC201 side of R302).
- (3) Adjust T301 so as to maximize the signal on the oscilloscope.

#### 5. PICTURE

##### White Balance Adjustment

Note: Allow 12 minutes warm-up time before adjustment.

- (1) Feed in a monoscope pattern (or equivalent) signal.
- (2) Set VR901 (R. DRIVE), VR902 (B. DRIVE), VR903(R. BIAS), VR904(G. BIAS) and VR905 (B. BIAS), to the mechanical center positions. Set SCREEN VR, PICTURE VR and SHARPNESS VR to their minimum positions and set B LEVEL VR to its center position.
- (3) Connect a jumper lead between TP401 and ground. Adjust the SUB B LEVEL VR (VR702B) so that the voltage at the G.K terminal of the CRT is 170VDC.
- (4) Turn the SCREEN VR gradually clockwise, until the first colored horizontal line appears faintly on the screen.
- (5) Turn the BIAS VR of the first colored line counterclockwise until it disappears.
- (6) Turn the SCREEN VR gradually clockwise to produce a second barely visible colored horizontal line on the screen. Similarly turn the BIAS VR counterclockwise until it disappears.
- (7) Turn the SCREEN VR gradually clockwise to produce a third barely visible colored horizontal line on the screen, but this time do not adjust the BIAS VR.
- (8) Turn the BIAS VRs of the first and second colors clockwise until they appear on the screen as brightly as the third color. At this time, the BIAS VR of the third color is at its mechanical center, and the white balance is adjusted.
- (9) However if the remaining color does not appear at item (7) even if the SCREEN VR is at maximum, turn the associated BIAS VR by 45 degrees in a clockwise direction and repeat steps (4) through (8).
- (10) Remove the jumper lead from TP401.
- (11) Set the B LEVEL VR and PICTURE VR to their maximum positions and check the White balance by adjusting VR901 and VR902.
- (12) Turn the B LEVEL VR and PICTURE VR to confirm the tracking of the white balance. If necessary, repeat steps (3) through (11).

## 6. SUB B LEVEL VR ADJUSTMENT

- (1) Feed in a monoscope pattern signal.
- (2) Set the B LEVEL VR to the center click position and turn the PICTURE and SHARPNESS VRs to the minimum position.
- (3) Adjust the SUB B LEVEL VR (VR702B) so that square A and B of the contrast chart are black, and square C is just barely lighter than square A.

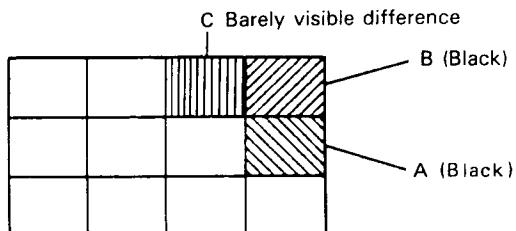

Fig. 2

## 7. COMB FILTER ADJUSTMENT

- (1) Feed in a standard color bar signal.
- (2) Connect an oscilloscope between pin 13 of IC201 and ground. Set the oscilloscope to 0.5V/div.
- (3) Adjust T6001 and VR6001 alternately to minimize the chrominance element in the video signal.

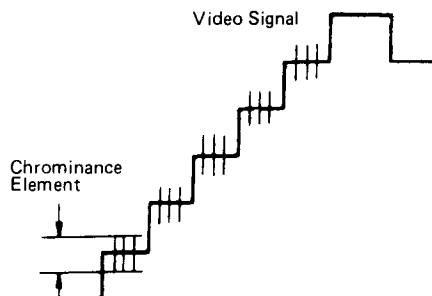

Fig. 3

## 8. SUB COLOR AND SUB TINT ADJUSTMENT

- (1) Feed in a standard color bar signal and set the AUTO COLOR switch to the ON position.
- (2) Set the COLOR VR and TINT VR and B LEVEL VR to their center positions. Set the PICTURE VR to its minimum position.
- (3) Connect an oscilloscope between the "BK" terminal on the VIDEO-CRT PWB and ground. Set the oscilloscope to 5V/div.
- (4) Adjust the SUB COLOR VR (VR702H) and SUB TINT VR (VR702F) to obtain the waveform on the oscilloscope shown in Fig. 4.

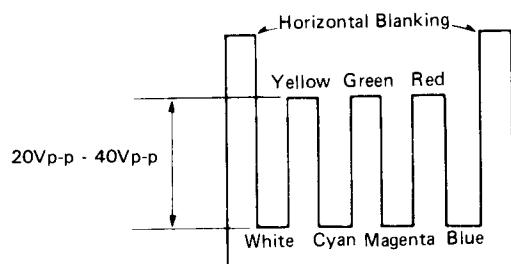

Fig. 4

## **9. SD FREE-RUN FREQUENCY ADJUSTMENT**

- (1) Connect a 16V/100 $\mu$ F capacitor between pin 5 of IC104 and ground. Thereafter, connect a probe of CH1 of a two channel oscilloscope to the terminal "VT3" and another probe of CH2 to pin 9 of IC104 respectively.
- (2) Feed in a color bar signal.
- (3) Set the oscilloscope to dual mode (two channel mode) and its time axis to the horizontal sync mode. Adjust trigger of CH1 to obtain a synchronized color bar signal on the scope.
- (4) Adjust VR101 so the 15.75kHz sawtooth waveform in CH2 is synchronized and comes to a standstill.

## **10. HORIZONTAL AND VERTICAL ADJUSTMENT**

### **10-1. Horizontal Position**

- (1) Feed in a monoscope pattern signal.
- (2) Adjust the center of the picture to the correct position using the H. CENTERING switch (S501). The centering switch can be set at either R or L.

### **10-2. Vertical Position and Vertical Height**

- (1) Feed in a monoscope pattern signal.
- (2) Adjust the center of the picture to the correct position using the V. CENTERING switch (S401).
- (3) Adjust the V. HEIGHT VR (VR401) so that the outer circle of the pattern is correctly shaped.

## **11. HIGH VOLTAGE CHECK**

- (1) Feed in a blank raster signal. Check that +B2 is 130VDC.
- (2) Set the B LEVEL and PICTURE controls to their minimum positions and check that the CRT anode voltage is 27.90  $\pm$  1kV.

## **12. HIGH VOLTAGE PROTECTOR CHECK**

- (1) Feed in a blank raster signal. Set PICTURE and B LEVEL to their minimum positions.
- (2) Turn the VACATION SW off and short R691A (210 $\Omega$ /16W) with a switch, then turn the VACATION SW on.
- (3) Set the AC line voltage at about 90Vrms and switch POWER on. Gradually increase the AC line voltage and confirm that high voltage protector operates and that horizontal oscillation stops.
- (4) The high voltage protector should operate at less than 35.13kV.
- (5) Turn off the VACATION SW and remove the switch from R691A.  
After 10 seconds, turn on the VACATION SW and then the POWER SW. Confirm that the set operates normally.

## **13. FOCUS CONTROL ADJUSTMENT**

- (1) Feed in a crosshatch pattern signal.
- (2) Set the B LEVEL VR and PICTURE VR to their maximum positions.
- (3) Adjust the FOCUS VR so that the central part of the crosshatch shows the sharpest details.

## 14. SOUND MULTIPLEX

- (1) Feed in a 100% modulated 400Hz monaural signal.
- (2) Adjust VR301 so the output at TP301 is  $247.5 \pm 5\text{mVrms}$ .

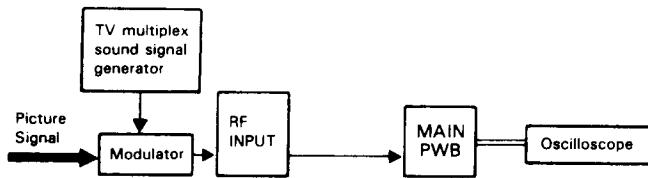

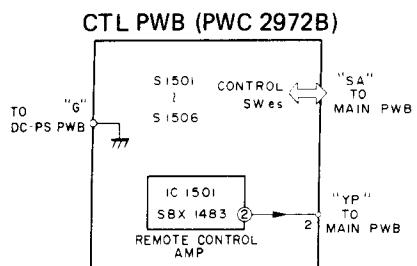

Fig. 5 Input Connection

## 15. SOUND OUTPUT ADJUSTMENT (BALANCE)

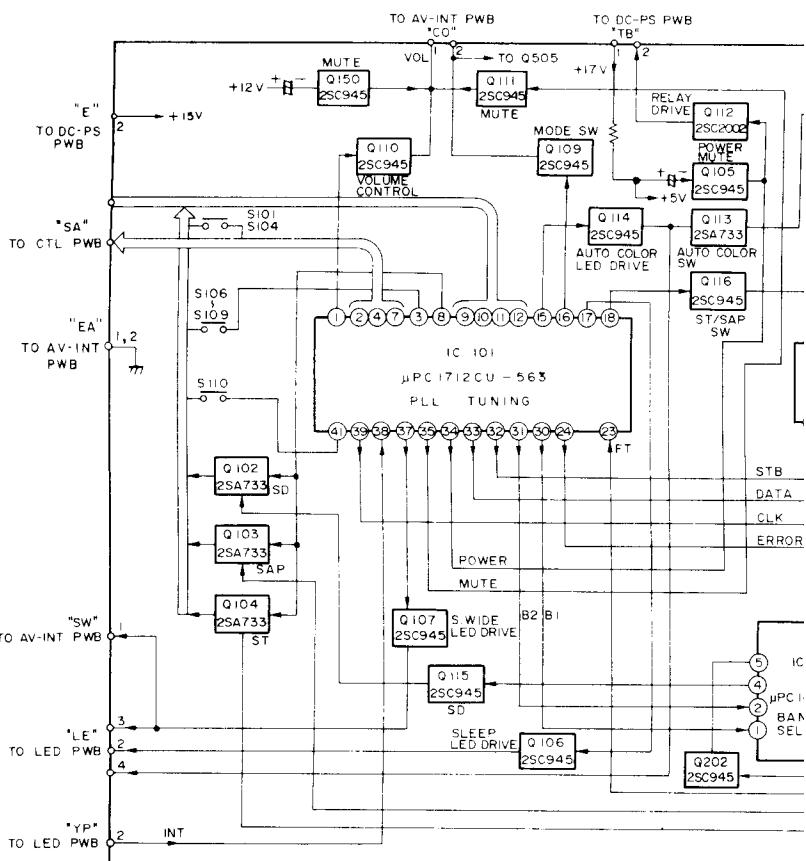

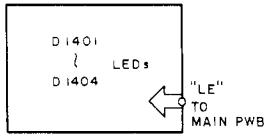

### 15-1. L ch, R ch Balance Adjustment

- (1) Apply 400Hz signal to the left channel audio input jack.
- (2) Set the controls and switch as follows:  
    TV/VIDEO - VIDEO  
    SPEAKER switch - ON
- (3) Connect an AC RMS voltmeter between TP6002 and ground.
- (4) Set the VOLUME to obtain  $2.8 \text{ Vrms} \pm 0.2\text{Vrms}$  ( $1\text{W}$ ) on the voltmeter.
- (5) Connect the voltmeter between TP6001 and ground.  
Adjust VR6101 to obtain the same reading as in step (4).

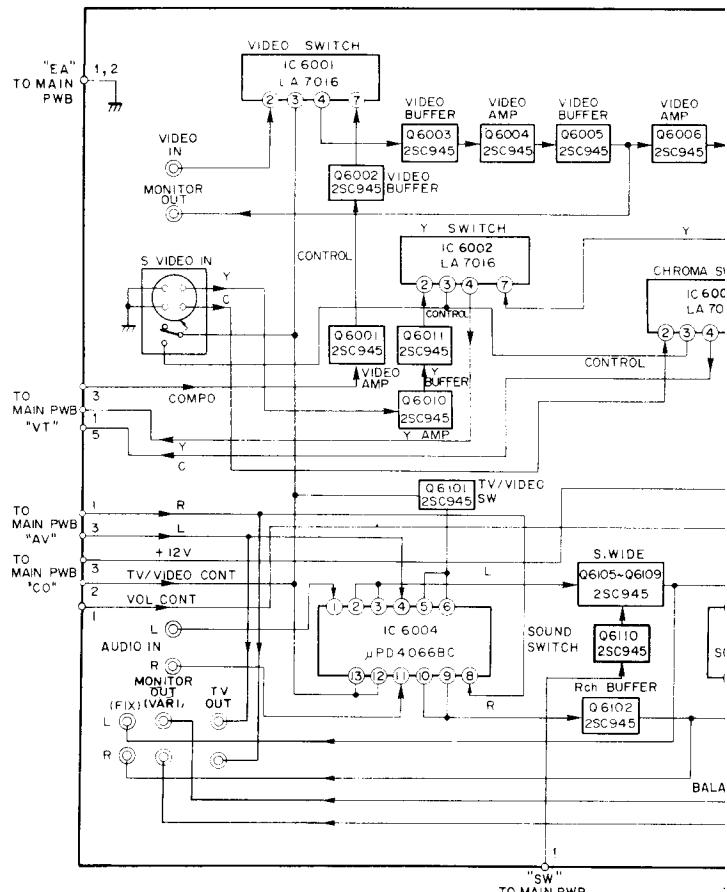

## BLOCK DIAGRAMS

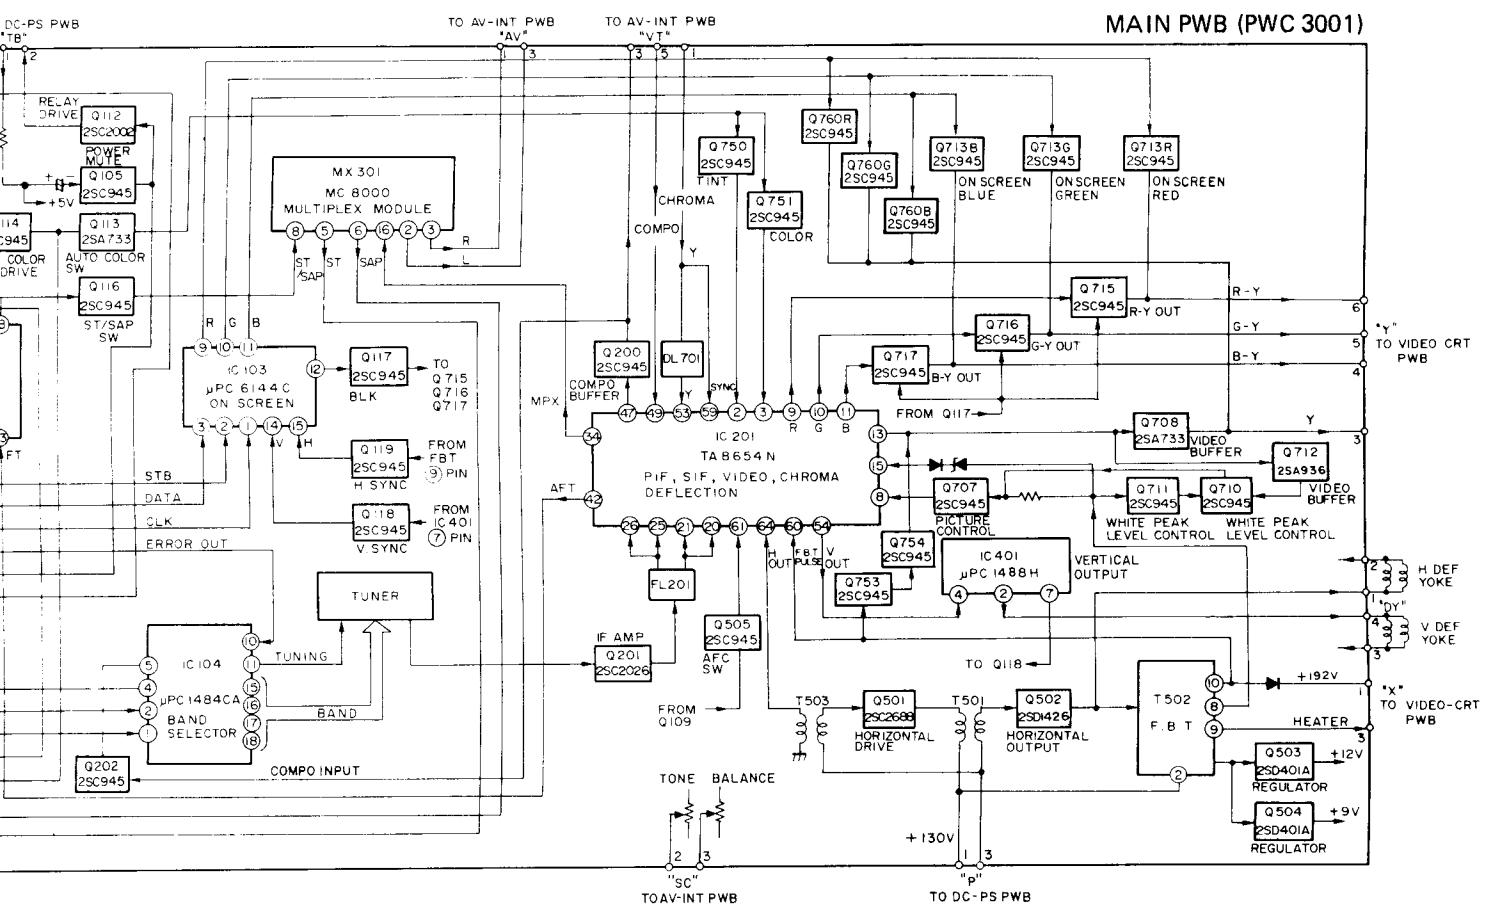

LED PWB (PWC 2972A)

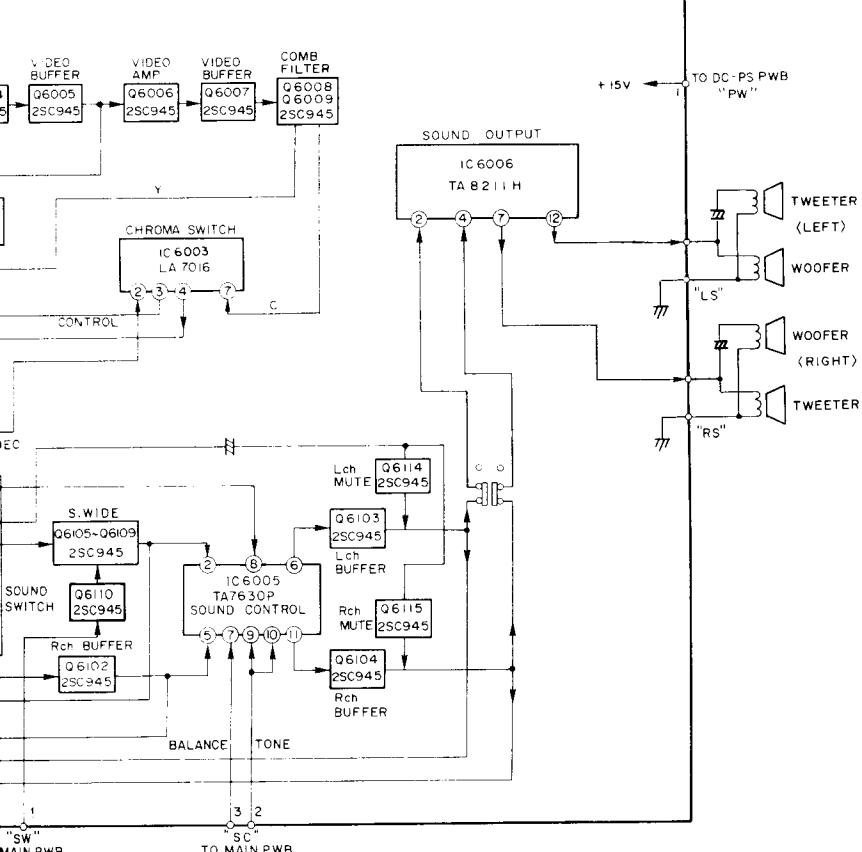

This circuit diagram illustrates the power supply and degaussing sections of the DC-PS PWB (PWC 298). The power supply section includes a full-wave rectifier with diodes D651 and D654, a filter capacitor C601, and a zener diode Z601 for +15V output. A second zener diode Z602 provides +130V. The degaussing section features a degaussing coil connected to a switch S691 and a timer TH601. AC input at 120V 60Hz is processed through a bridge rectifier with diodes F601 and F602, and a filter network with resistors R601, R602, and R603, along with capacitors C601 and C602.

## REPLACEMENT PARTS LIST

**Notes:**

1. Parts orders must contain model name, parts number and description.
2. When you place an order for spare parts, please refer to the respective service manual and mention the right parts number on your P.O. Sheets.
3. Standard resistors, capacitors and coils which are normally available from local electronics suppliers are not stocked in our warehouse.
